Environmental Policy

CG Drives & Automation offers products, systems, services and project solutions that not only increase our customers' results but also reduce their environmental impact through improved energy efficiency and increased productivity.

To safeguard the environment, we work according to the guidelines of ISO 14001. This means that we are determined to reduce the environmental impact further by adapting a systematic approach to our processes in the company. In addition to having a structured environmental work, it also means, in short, that we take care of our customers' needs and ensure that the internal working methods are cost-effective in line with our and the partners' environmental objectives. We take a very positive view of the demands placed on our industry and we always aim for continuous improvement and development in the following areas, among other things.

- When choosing components, fuels and vehicles, within the framework of our business idea and financial opportunities, we should all choose alternatives that are environmentally friendly, eco-labeled or of the latest environmental class.
- We shall actively work to reduce our consumption of fossil fuels linked to transport by planning trips with the aim of reducing mileage and having an environmentally adapted driving style.
- We will work with environmentally adapted waste and waste management within the company.
- We will work to ensure that our suppliers and partners have a high environmental awareness and that they are sharing our beliefs and standards.
- We shall prevent pollution by maintaining and servicing our equipment and handling chemicals in a safe way, thereby committing ourselves to protecting the environment.
- We will work on our improvement work in the long term, which takes into account and adheres to internal and external requirements and applicable legislation and other binding requirements that affect the company's environmental aspects.
- The principles of risk reduction and continuous improvement are also reflected in how we look at product development. We develop environmentally efficient and recyclable products where we take environmental effects into account when designing new or developing existing products
